1 When Is Consumption Growth Declining in m?

Henceforth indicating appropriate arguments by the corresponding subscript (e.g. $c'_{t+1} \equiv c'(m_{t+1})$), since $\Gamma_{t+1}\mathcal{R}_{t+1} = R$, the portion of the LHS of equation (53) in brackets can be manipulated to yield

$$c_{t} \Upsilon'_{t+1} = c'_{t+1} a'_{t} R - c'_{t} \Gamma_{t+1} c_{t+1} / c_{t}$$

$$= c'_{t+1} a'_{t} R - c'_{t} \Upsilon_{t+1}. \tag{1}$$

Now differentiate the Euler equation with respect to m_t :

$$1 = \mathsf{R}\beta \, \mathbb{E}_t [\Upsilon_{t+1}^{-\rho}]$$

$$0 = \mathbb{E}_t [\Upsilon_{t+1}^{-\rho-1} \Upsilon_{t+1}']$$

$$= \mathbb{E}_t [\Upsilon_{t+1}^{-\rho-1}] \, \mathbb{E}_t [\Upsilon_{t+1}'] + \operatorname{cov}_t (\Upsilon_{t+1}^{-\rho-1}, \Upsilon_{t+1}')$$

$$\mathbb{E}_t [\Upsilon_{t+1}'] = -\operatorname{cov}_t (\Upsilon_{t+1}^{-\rho-1}, \Upsilon_{t+1}') / \, \mathbb{E}_t [\Upsilon_{t+1}^{-\rho-1}]$$
(2)

but since $\Upsilon_{t+1} > 0$ we can see from (2) that (53) is equivalent to

$$\operatorname{cov}_t(\Upsilon_{t+1}^{-\rho-1}, \Upsilon_{t+1}') > 0$$

which, using (1), will be true if

$$cov_t(\Upsilon_{t+1}^{-\rho-1}, c'_{t+1}a'_tR - c'_t\Upsilon_{t+1}) > 0$$

which in turn will be true if both

$$cov_t(\Upsilon_{t+1}^{-\rho-1}, c'_{t+1}) > 0$$

and

$$\operatorname{cov}_t(\boldsymbol{\Upsilon}_{t+1}^{-\rho-1},\boldsymbol{\Upsilon}_{t+1}) < 0.$$

The latter proposition is obviously true under our assumption $\rho > 1$. The former will be true if

$$\operatorname{cov}_t ((\Gamma \psi_{t+1} c(m_{t+1}))^{-\rho-1}, c'(m_{t+1})) > 0.$$

The two shocks cause two kinds of variation in m_{t+1} . Variations due to ξ_{t+1} satisfy the proposition, since a higher draw of ξ both reduces $c_{t+1}^{-\rho-1}$ and reduces the marginal propensity to consume. However, permanent shocks have conflicting effects. On the one hand, a higher draw of ψ_{t+1} will reduce m_{t+1} , thus increasing both $c_{t+1}^{-\rho-1}$ and c'_{t+1} . On the other hand, the $c_{t+1}^{-\rho-1}$ term is multiplied by $\Gamma\psi_{t+1}$, so the effect of a higher ψ_{t+1} could be to decrease the first term in the covariance, leading to a negative covariance with the second term. (Analogously, a lower permanent shock ψ_{t+1} can also lead a negative correlation.)
